

Building the Working Install

To set up the Working Install, use the following directions. Once Guppy is running on the Working Install, the Map Viewer clients can update both the program and maps, as described in the *Map Viewer Installation* document.

1. Copy the *Partner* folder and the four directories *Maps*, *MapViewer*, *Platform*, and *Shared* to the Working Install computer. **The Working Install computer must have a fixed IP address.**
2. Run *Partner/Platform/resources/CalculateAllChecksums.bat* on the Working Install.
3. On the Working Install, run *Partner/Platform/resources/guppy.bat*.
4. Record the IP address reported by guppy. Check with a system administrator to verify that the address reported by Guppy will always be the IP address for the computer.
5. Open up the file *Partner/Platform/config/customer/HostNames.tof* with a text editor such as Notepad. **Do not use Microsoft Word.**
6. Change the line that says "Guppy" = "10.0.0.1" to the fixed IP address reported by Guppy in step 4. For example, change 10.0.0.1 to 192.168.10.20. Make sure to leave the quotes around the address.
7. Start the Map Translator on the Map Translator computer.
8. Select "Post Maps to Network".
